(54) Title: A METHOD AND AN APPARATUS FOR PRODUCING ICE CONFECTION

(57) Abstract: The present invention concerns an apparatus and a method for producing ice confection comprising mould cavities arranged on lamellae disposed in an endless belt along which are arranged process means for the production of the ice confection by conveying the lamellae between the process means, wherein the apparatus comprises an uneven number of lamellae and the process means are arranged along the belt in such a way, that the ice confection production process may be completed by two full circulations of one lamella on the belt. Due to the uneven number of lamellae a specific lamella will change stop position for each circulation. Hereby, a number of advantages are obtained through an optimal utilization of the lower lamella sequence, such that the shortest possible apparatus is obtained.
